Errors encountered	3

Overview

The account gained \$331.00 on the day, ending at \$100,445.43 equity. One new position was opened -- AMD, 13 shares at \$480.31, entered by the rd-agent mean-reversion strategy off a z-score of -2.21. The four open positions (AMD, GOOGL, NFLX, TSLA) closed the day with a combined unrealized gain of roughly \$445, with NFLX the strongest contributor and TSLA the largest drag. The Sneaky Pivot day-trading strategy, deployed for the first time today, did not execute any trades -- it was brought online mid-session, after its entry window (roughly the first two hours after market open) had already closed for the day, so today produced no real test of its trading logic. Protective stops were actively managed throughout the day: 9 separate stop-raising or stop-placement actions kept all four open positions covered as prices moved. Three technical errors surfaced during stop management, all traced to the same underlying issue and fixed same-day -- see Mistakes & Corrected Actions below.

Market Movement

The watchlist was broadly quiet today, with no ticker moving more than about a tenth of a percent from the prior close as of this report. This is a calmer picture than an earlier data pull suggested -- that pull incorrectly showed several names down 3-5%, which turned out to be a data quality problem (see Mistakes & Corrected Actions), not a real market move. With that corrected, today was a non-event day for the watchlist as a whole. Within the portfolio, NFLX continues to be the standout position (unrealized gain of \$450.95, the largest of the four), GOOGL and AMD are modestly positive, and TSLA remains the one position underwater, down \$362.32 unrealized against its entry -- though its protective stop has been raised twice today as the price has partially recovered.

Open Positions

Ticker	Qty	Avg Entry	Current	Unrealized P&L
AMD	13	\$480.31	\$490.65	\$134.44
GOOGL	31	\$319.13	\$326.30	\$222.50
NFLX	145	\$67.89	\$71.00	\$450.95
TSLA	28	\$321.01	\$308.07	\$-362.32

Mistakes & Corrected Actions

A stop-order replace request repeatedly failed for TSLA (3 errors logged) because the system was tracking the wrong order: when a symbol had two open orders at once (a stuck one and its live replacement), the code had no way to tell them apart and sometimes picked the stale one.

Corrected action: Fixed to prefer the order in a stable, working state over one still mid-transition. Confirmed the position was never actually left unprotected during this -- the real stop order stayed active throughout, it just couldn't be raised further until the fix went in.

Discovered that every protective stop placed through the normal buy process was silently set to expire at the end of the trading day, rather than staying in place indefinitely as intended -- confirmed for real when AMD's stop expired exactly at market close, leaving that position briefly unprotected.

Corrected action: The stop-monitoring process now checks every position each cycle and explicitly extends any stop that's still on a same-day-only basis, independent of whether the price has moved. This closes the gap going forward; a very small window remains for a position bought in the last few minutes before close, which is now clearly documented rather than assumed away.

The Sneaky Pivot strategy's very first signal (META) was generated from a stale setup several hours old rather than a live one, because its entry logic was re-scanning old price history instead of only looking at the most recent bar.

Corrected action: Caught before it could execute by double-checking the signal against a live price quote, which showed the trade would have opened already well past where its own stop-loss should have been. Fixed so the strategy only ever acts on the current bar going forward, and the bad signal was manually invalidated rather than left sitting in the queue.

This report's own market-movement numbers were initially wrong -- one ticker (AAPL) showed a fabricated 99% drop, and several others showed exaggerated moves, because after-hours price quotes on the current data feed are sometimes stale or unreliable.

Corrected action: Switched the report to use actual last-traded prices instead of bid/ask quotes, and added a sanity check that excludes any reading implying an implausibly large single-day move rather than reporting it at face value.

Errors Encountered (raw log)

Time	Source	Ticker	Error
20:48:30	trailing_stop_cycle	TSLA	APIError: {"code":42210000,"message":"order already pending replacement"}
20:48:49	trailing_stop_cycle	TSLA	APIError: {"code":42210000,"message":"order already pending replacement"}
21:10:05	trailing_stop_cycle	TSLA	APIError: {"code":42210000,"message":"order chain not fully replaced"}
